## End Markets

Peninsula Compost Company, LLC. (Peninsula) is a commercial composter that receives source separated food and yard waste from various sources throughout the area. Utilizing the Gore ® Cover System In-vessel composting technology, Peninsula produces quality compost and manufactures soil amendments.

Compost can be utilized to provide moisture control for landscape and nursery plantings, soil amendments for agricultural uses, to improve growth and control weeds in ornamental plantings and as a bioretention soil media for storm water management controls.

Peninsula has been in operation for over five (5) years and as such has established markets for the various products generated at the recycling facility. End users for the compost and soil amendments include agricultural, landscaping, plant nurseries, public agencies and private individuals.

Peninsula continues to market their compost products and expand available end use markets. An example of the current marketing success includes a recent commitment to purchase up to 50,000 cubic yards of compost from a large nursery. This one customer is expected to utilize a significant amount of the compost produced by the Facility annually. Regarding expanding markets in the past year Peninsula has been working with an agriculture consultant who has located some very viable end users for large volumes of compost and soil amendments. An additional expanding market that is considered to have great potential for Peninsula is the DNREC Storm water regulations which require the implementation of Best Management Practices (BMP's) such as the use of bioretention facilities which will result in rapid demand increase for bioretention soil media.
